Figure 1: BSE micrographs of the L03 microstructure after annealing at 900 °C for a) 168 h, b) 1000 h, c) 2000 h, d) 4000 h, and e) 8000 h. The brightest phase in each image is D0\textsubscript{19}, black is B2, dark gray is $\gamma$ and light gray is $\gamma'$. The scale bar in a) is representative of all images (i.e. the magnifications are the same).
